Let's Start!

As computing evolved, machines were more complex.

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor. Build the macro system conceptual model following the customer requirements, through the use and interpretation of collected information, represented in class diagrams, interaction diagrams, and operation contracts.

Can Do Statements:

- I can understand written information about some facts in computing history.
- I can talk about the origins of object oriented programming.
- I can paraphrase information from a text.

Ask your partner:

- Why do you think computing evolves that fast?
- What changes in computing do you think were the most important during the XX century? Why?

Let's Explore!

Sam is paraphrasing some facts about the computing history in a draft*.

*"Draft" refers to a provisional version of a paper you make before making the final version

Instructions: Read the text below.

Computing is constantly evolving. In the 1960's, mainframes appeared, these large machines were able to manage large volumes of information in an efficient way. Not very long after, the concept of PC or personal computer started to be very important, organizations acquired more PC's to use administrative software, and people had PC's at home for personal purposes such as the use of word processors or spreadsheet applications.

Years later, technology advanced and revolutionized communications. In 1989, the World Wide Web appeared together with the first web browser, and from that time, the communication by email became part of people's daily lives. These two elements were essential to develop new technologies such as e-commerce and social networks, and people had a better and faster access to information.

Computer systems changed too. In the 1950's, engineers used machine code languages, however, they were very complex and difficult to manipulate. Later, in the 1960's, high-level languages were famous because they were simple and helped in the development of more complex computer programs. Then, in the 1970's, experts standardized the structured programming paradigm for complex software, this paradigm divided programs into small components so they were easier to manage. However, the paradigm failed because it was difficult to understand how to create software or how to modify existing software.

In the 1990's, the object-oriented paradigm appeared, it developed ideas that were important for the use of Object Oriented Language. This paradigm was revolutionary because it allowed creating more evolved software components where it was possible to operate together software and data.

Certainly, software development ideas and computing are still changing and they will keep innovating.

Let's Practice!

Computing is constantly evolving.

Instructions: Write the words to correctly complete the sentences. Use words from the box below.

Word Bank

used / managed / started / acquired

Computing is constantly evolving. In the 1960's, mainframes appeared, these large machines _____ large volumes of information in an efficient way. Not very long after, the concept of PC or personal computer _____ to be very important, organizations _____ more PC's to use administrative software, and people _____ PC's at home for personal purposes such as the use of word processors or spreadsheet applications.

Let's Practice!

What are the origins of object-oriented programming?

Instructions: Organize the mystery sentence.

Read the sentences aloud. Check your pronunciation with your instructor.

1. common / In 1950s, / to / was / machine code languages. / use / it
2. simpler / were / in the 1960's, / high-level languages / because / they / famous / Later, / were
3. allowed / because / was / object-oriented paradigm / more evolved / The / revolutionary / it / creating / software components. /

Extension Activity

Paraphrasing an Article

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for an article about modern computing history.
- Identify 5 main ideas about modern computing history.
- Paraphrase these ideas and write a short text.
- Share your text with a classmate.

Self-Assessment

Yes

No

- I look for an article about modern computing history.
- I identify 5 main ideas about modern computing history.
- I paraphrase these ideas and write a short text.
- I share my text with a partner.

☐	☐
☐	☐
☐	☐

Target Words

- **mainframe** (noun): server computer
e.g. Computing is constantly evolving. In the 1960's, mainframes appeared, these large machines were able to manage large volumes of information in an efficient way.
- **programming paradigm** (noun): way you use to classify programming language within model computation
e.g. Then, in the 1970's, experts standardized the structured programming paradigm for complex software.
- **machine code** (noun): program memory
e.g. In the 1950's, engineers used machine code languages, however, they were very complex and difficult to manipulate.
- **word processor** (noun): software application that allows you to create, edit and print documents
e.g. people had PC's at home for personal purposes such as the use of word processors or spreadsheet applications.
- **spreadsheet** (noun): program that calculates and organizes information in rows and columns
e.g. people had PC's at home for personal purposes such as the use of word processors or spreadsheet applications.

Learning Points

Simple Past of Verb to Be in Affirmative Statements

You use **simple past of the verb to be** to talk about location, describe qualities or express feelings in the past.

In **simple past**, the verb **to be** has two irregular forms. The conjugation changes according to the pronouns, we use **was** with singular pronouns and **were** with plural pronouns.

For example:

*Computing **was** very different in the mid-twentieth century.*

*Computer programs **were** complex to use at the beginning.*

This is the structure you to build affirmative statements with the verb to be in simple past:

Subject + **was/ were** + complement.

Verb To Be in Past	
Pronoun	BE
I	was
You	were
He / she / it	was
We/They	were

Examples

- *These two elements were essential to develop new technologies such as e-commerce and social networks*
- *In the 1950's, engineers used machine code languages, however, they were very complex and difficult to manipulate.*
- *This paradigm was revolutionary because it allowed creating more evolved software components.*

Learning Points

Simple Past Tense in Affirmative Statements with Regular Verbs

You use the **simple past** to describe actions that happened in a specific time in the past.

To make affirmative sentence in the **simple past**, you should use verbs in past form:

Subject + **Verb in Past** + Complement.

Examples:

*The first programming languages **appeared** in the 50's.
People **started** to use email accounts in the 90's.*

Verbs in past are classified in regular and irregular ones. The past form of **regular verbs** is simple, you just need to add **-d -ed** or **-ied** at the end of the verb:

For those regular verbs that finish in **-e** or in **vowel + y**, you have to add **-d**:

*create → **created**
manage → **managed**
play → **played***

When a regular verb finishes in **-d** or **-t**, you have to add **-ed**:

*invent → **invented**
mend → **mended***

For those verbs that end in **consonant + y**, you have to change the **y** and add **-ied**:

*study → **studied**
try → **dried***

Be careful, not all verbs are regular. **Irregular verbs** can change in different forms, you need to practice them and memorize them, for example:

*keep → **kept**
think → **thought**
become → **became***

Examples

- *In the 1960's, mainframes appeared, these large machines were able to manage large volumes of information in an efficient way.*
- *Years later, technology advanced and revolutionized communications.*
- *Computer systems changed too. In the 1950's, engineers used machine code languages, however, they were very complex and difficult to manipulate.*

Learning Points

Paraphrasing Information

You **paraphrase information of a text** when you want to express essential ideas in your own words.

You paraphrase when you want to make a summary or add additional details to the information in a text. When you are paraphrasing, you don't quote passages but you give your own understanding of the legitimate text.

In the following chart, you can find some steps to paraphrase information effectively:

1.	Read the text until you understand all the information.
2.	Write down keywords or phrases that can remind about the essential information.
3.	Make a draft writing your own ideas.
4.	Check your draft and compare the accuracy of the information in comparison to the legitimate text.
5.	Use quotation marks to identify technical and unique information you take from the original text
6.	Write the name and author of the text if you want to use it as a bibliography for your paper.
