Let's Start!

Information Package!

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor. Build the macro system conceptual model following the customer requirements, through the use and interpretation of collected information, represented in class diagrams, interaction diagrams, and operation contracts.

Can Do Statements:

- I can simply say what a package in UML is.
- I can discuss simple ideas in real life that explain the concept of packages.
- I can say how to draw a package diagram using the URL of an organization.

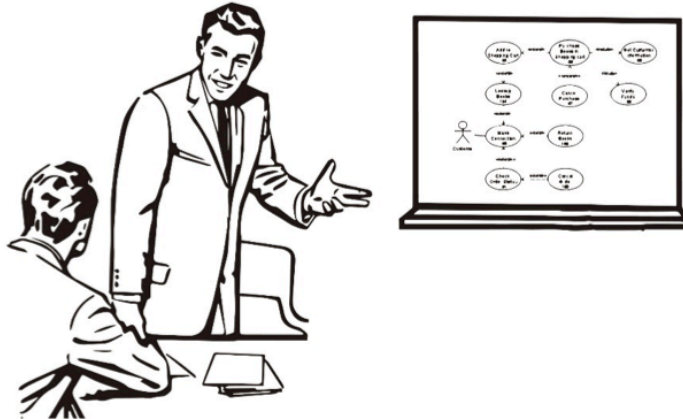

Ask your partner:

- Do you think UML diagrams should divide information into subcategories? Why?
- Why do you think classes should have a dependency among them?

Let's Explore!

Can the web designer explain how to make package diagrams for the company?

Instructions: Read the text below.

Manager: So, can package diagrams show the architecture of a system?

Designer: Sure! Package diagrams, as maps, can show spatial information that represents the general architecture of a system. Basic components or packages can help us arrange information in the diagram.

Manager: Can you describe packages as a visual representation?

Designer: Not really. You can define a package as a directory that contains a group of related classes.

Manager: Can I name each package the way I want?

Designer: Absolutely! You can name information packages, but remember that you have to follow a specific hierarchy, I mean, you can convey any kind of information but you always need to include a root directory of the package and then the sub-directories of the system.

Manager: Can you explain a package diagram to me?

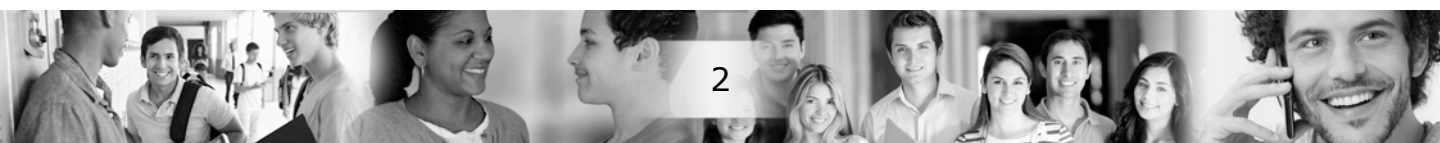

Designer: Let me give you an example. You want your store to have a website, so you need the information you want to include. You can depict the classes or product information within the package; packages or type of clothing that contain products or classes and those dependencies you want to have between those dependencies. Once you have the information, you can create a diagram that represents packages and classes.

Manager: How can I show that information to customers?

Designer: Well, you can use a unique URL for your organization; then you can include your three packages that represent target buyers; after that, you can show the classes or products you offer, and finally, include that information as part of one same catalogue.

Manager: Great! My website can be www.clothes&clothes.com

Designer: Sure! But remember that you have to decode your URL once you create a package diagram.

Let's Practice!

The package diagrams can be helpful.

Instructions: Classify the sentences by writing the number of the sentence in the correct category.

1. Show the architecture of a system with a package.
2. Name each package the way you want.
3. Define it as a visual representation.
4. Create it without a specific hierarchy.

Things you can't do with a package.	Things you can do with a package.

Let's Practice!

You can use package diagrams.

Instructions: Complete the sentences by writing its corresponding Word that indicates possibility. Use capital letter where necessary.

Optional Instructions:

Read the sentences aloud. Check your pronunciation with your instructor.

1. Mr. Stevens, I have a question. _____ package diagrams show information that represents the general architecture of a system?
2. Package diagrams _____ represent target buyers.
3. Miss Beatty. _____ you describe the product information within the package diagram?

Extension Activity

Let's look for package diagrams!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for a URL with package diagrams.
- Describe the package diagrams that you can recognize.
- List all the diagrams you see.
- Share it with your class.

Self-Assessment

Yes

No

1. I look for specific information in a URL.

☐
☐

2. I describe package diagrams with the information I learned in this learning material.

☐
☐

3. I list all the diagrams I can see in the URL.

☐
☐

Target Words

- **root directory** (noun): the first or most important directory in a hierarchy
e.g. You can convey any kind of information but you always need to include a root directory of the package and then the sub-directories of the system.
- **depict** (verb): to describe
e.g. You can depict the classes or product information within the package.
- **spatial** (adjective): something that takes a specific space
e.g. Sure! Package diagrams, as maps, can show spatial information that represents the general architecture of a system.
- **directory** (noun): group of files
e.g. Not really, you can define package as a directory that contains a group of related classes.
- **hierarchy** (noun): the arrangement of things depending on how important they are
e.g. You can name information packages but remember that you have to follow a specific hierarchy.
- **convey** (verb): to express, to present
e.g. You can convey any kind of information but you always need to include a root directory of the package.

Learning Points

Modal Verb Can in Affirmative Statements and Questions

You use the **modal verb can** to talk about possibilities.

You use the modal verb **can** in present statements that is, or is not possible for someone to perform. The modal verb '**can**' doesn't change, no matter what subject you use.

You can use the modal verb '**can**' in affirmative present statement by following this structure:

Subject + Modal verb can + main verb + Complement.

Example:

*I **can** create a package diagram.*

You can use the modal verb '**can**' in questions by following this structure.

Modal Verb Can + main verb + Subject + Complement?

Example:

***Can** you create a package diagram?*

Examples

- *Can package diagrams show the architecture of a system?*
- *Package diagrams, as maps, can show spatial information that represents the general architecture of a system.*
- *Basic components, or packages, can help us arrange information in the diagram.*

Learning Points

Drawing a Package Diagram Using the URL of an Organization

You use **URL** for drawing unique package diagrams of an organization.

Organizations can create a unique URL. This URL is composed by the associations of several packages. Those packages highlight their relationship and determine a number of classes within each package.

Now, each part of the URL is a package. A package diagram shows part by part the composition of the URL.

Let's see how to convey this information into a package diagram:

- URL: www.packagediagram.com
Name: PackageSample
- #Packages: 3
- #Classes: 6
