**Let's Start!**

Is UML a system of processes?

UML

Learning Outcome:

Describe common simple incidents at work in a simple spoken or written situation with a supportive interlocutor. Build the macro system conceptual model following the customer requirements, through the use and interpretation of collected information, represented in class diagrams, interaction diagrams, and operation contracts.

Ask your partner:

- What does methodology mean? Why is it important in information systems?
- How does the diagramming notation work? Explain.

Can Do Statements:

- I can say what a methodology is to information systems.
- I can talk about UML as a diagramming notation.
- I can list some diagrams used in UML.

Let's Explore!

Specialist clarifies UML concepts in his speech*.

*"Speech" refers to a presentation you made in front of many people

Instructions: Read the text below.

Specialist: People sometimes define UML as a methodology, but you have no idea of how mistaken they are. UML is not what you think, this is not a system of processes, this doesn't give us an outcome of the analysis, and this doesn't organize tasks sequentially; in other words, this is not a methodology itself. A methodology is the one that organizes activities within a sequence, and it can be sometimes useful to organize an informational system, even when that is not what we look for in UML.

On the other hand, UML is always popular for its diagramming notations, those are not textual notations, but they represent technical and graphical information. Clearly, these are not barcodes, but they are diagrams that represent program designs and make them useful. Diagrams, sometimes, use different arrows to indicate relationships, so those are not complicated because they usually have clear and understandable information.

Diagrams don't need to follow a standard methodology or process because these are not mandatory requirements for creating designs. Remember that they don't express precise graphical notations. UML uses diagrams because this is not a methodology, but a very precise diagramming notation. Every single diagram is useful for three or more applications within the system; for instance, you can use object diagrams for describing the data within the system or package and class diagrams for describing the architecture of the system. UML usually uses different arrows for precisely giving meaning to each notation.

Finally, UML allows the suppression within diagrams, so authors can suppress any detail they consider not relevant. Those details always include essential information for the reader.

**Let's Practice!**

What is methodology?

Instructions: Read the text and underline all the demonstratives.

UML is not what we think, that is not a system of processes, those doesn't give us an outcome to analyze, and it doesn't provide a sequence. In other words, these is not a methodology itself. On the other hand, A methodology helps to organize activities within a process, even when these is not what we look for in UML.

**Let's Practice!****Diagramming Notation**

Instructions: Select the correct answer.

1. UML _____ uses diagrams with a very precise diagramming notation.
 - a. never
 - b. seldom
 - c. always
2. Every single diagram _____ useful for three or more applications within the system.
 - a. is sometimes
 - b. sometimes are
 - c. never is
3. UML _____ different arrows to give precisely meaning to each notation.
 - a. usually uses
 - b. never uses
 - c. usually use
4. UML _____ popular for its diagramming notations.
 - a. is never
 - b. is always
 - c. always is
5. UML _____ represents technical and graphical information which is easy to visualize.
 - a. sometime
 - b. often
 - c. never

Extension Activity

Structural Diagram and Behavioral Diagrams

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more UML diagrams in your nearest library or on the Internet.
- Make a list of structural UML diagrams and behavioral UML diagrams.
- Choose one structural and one behavioral diagram to explain in a short presentation, describing all their characteristics.
- Present it to your class and your teacher.

Self-Assessment

	Yes	No
1. I search about UML diagrams.	☐	☐
2. I differentiate structural diagram and behavioral diagrams.	☐	☐
3. I explain a structural diagram and a behavioral diagram.	☐	☐
4. I prepare a short presentation about structural and behavioral diagrams.	☐	☐
5. I present it to my classmates and teacher.	☐	☐

Target Words

- **methodology** (noun): system of processes you use to achieve a goal or requirement
e.g. A methodology is the one that organizes activities within a sequence, and it can be sometimes useful to organize an informational system.
- **outcome** (noun): result
e.g. UML is not what you think, this is not a system of processes, this doesn't give us an outcome of the analysis, and this doesn't organize tasks sequentially.
- **suppression** (noun): exclusion of clearly irrelevant information
e.g. UML allows the suppression within diagrams, so authors can suppress any detail they consider not relevant.
- **UML** (abridging): Unified Modeling Language
e.g. UML uses diagrams because this is not a methodology, but a very precise diagramming notation.
- **diagramming notation** (noun): diagrams representing categories
e.g. UML is always popular for its diagramming notations, those are not textual notations, but they represent technical and graphical information.

Learning Points

Demonstrative Pronouns in Negative Statements

You use **demonstrative pronouns** to replace nouns in a sentence or before nouns.

The **demonstratives pronouns** are: ***This, That, These and Those***; you use them when you intend to point at a noun, or to replace a noun you mentioned before.

Use ***This*** and ***These*** to point at nearby things, and you use ***That*** and ***Those*** to point at things that are far.

Examples:

That methodology works with any software.

The company uses ***this*** diagram in UML.

You use **demonstrative pronouns** in negative statements with the present simple structure. Remember, you add a ***not*** after the verb in present.

Examples:

These are not the correct diagrams.

This is not working correctly.

Those diagrams ***don't*** identify software requirements.

These

	Singular	Plural
Near	This	These
Far	That	Those

Examples

- *UML is not what you think, this is not a system of processes, this doesn't give us an outcome of the analysis, and this doesn't organize tasks sequentially*
- *UML uses diagrams because this is not a methodology, but a very precise diagramming notation.*
- *Clearly, these are not barcodes, but they are diagrams that represent program designs and make them useful.*
- *UML is always popular for its diagramming notations, those are not textual notations, but they represent technical and graphical information.*

Learning Points

Adverbs of Frequency: Sometimes

You use **adverbs of frequency** to express how often things happen.

Sometimes is an **adverb of frequency** that means something happens exactly half the time. In the following chart, you can see the adverb **sometimes** located exactly in the middle, as the adverb sometimes refers to thing happening at regular time intervals.

Normally, you place the adverb of frequency **before** the action verb.

Example:

*They **sometimes** apply the behavior diagram.*

Remember that most of the time, when using sentences with verb to be, the adverb of frequency goes **after** the verb.

Example:

*When the boss asks us to use diagrams in UML, he is **sometimes** persistent on using another thing.*

100%	90%	70%	50%	30%	5%	0%
Always	Usually	Often	Sometimes	Occasionally	Hardly ever	Never

Examples

- *People sometimes define UML as a methodology, but you have no idea of how mistaken they are.*
- *It can be sometimes useful to organize an informational system, even when that is not what we look for in UML.*
- *Diagrams, sometimes, use different arrows to indicate relationships, so those are not complicated because they usually have clear and understandable information.*

Learning Points

Diagrams in UML

Diagrams are an incomplete representation of a system's model.

You use **diagrams in UML** to identify software requirements, implementations, and behaviors. There are many types of **diagrams in UML** depending on what you want to identify. For example, the ones that represent *behavior* can include aspects like *interactions* which you can organize in a hierarchical diagrams.

Remember, you can also use diagrams to detect omissions or errors in a system. These are the most common diagrams in UML:
